TSAFE DRM for Fonts

Digital Rights Management / Licensing / Protection of FONTS

Here is brief of Technology:

- Font files are zipped in an encrypted cabinet file. It's just like a zip file
- This zip or cabinet is created using a 200-character password (normally you may be using a 15-character password for your Email) and AES 128 encryption which is currently used in all banking systems. So, it's very safe.
- We will provide you a font installer which will mount the zip file as a drive on user system (say z://)
- This z:// drive will be accessible only to windows OS and not to explorer ensuring that font files are not accessible and hence cannot be copied anywhere.
- The font installer will install the fonts in windows so that they are accessible to all the software in windows. But font files will remain in z:\\ drive and not copied to the font folder. And z:// drive is not accessible to any user. Even if accessed using advanced tools, files cannot be copied as they are fully

protected.
- If the dongle is removed, z:// drive vanishes and fonts get uninstalled ensuring that they cannot be used.
- The system uses two different drives to protect file and mount a file as cabinet.

We will provide the following tools:

1. Dongle creator tool so that you can save 200 character password and create MASTER and USER dongle
2. Cabinet file creator so that you can create a cabinet or zip file using MASTER Dongle.
3. Installer so that the end user can install the software and run as needed.

What you need to give to the end user:

1. A USER dongle
2. Software with fonts (zip file) to install package

The software will use your brand name, splash screen and logo. It will not conflict with our other customers, and the dongle will be unique to you.

See images for Dongle design.

On Bulk orders (1000+) , we can print your logo or name on the dongle.
